SUMMARY OF QUALIFICATIONS

- Computer Engineering student building desktop AI tools, web apps, and automation from interface to delivery.
- TypeScript, React, Next.js, Electron, Python, JavaScript, SQL, Git, Playwright, Vitest, pytest, and Google Apps Script.

EDUCATION

4th Year at Queen's University **September 2023 – Present**

Computer Engineering · Expected graduation 2027

- Cumulative GPA of 3.85 · Dean's Scholar Award each year (2023-24 to 2025-26).

EXPERIENCE

Operations Technology Intern · Digital Operations Improvement **Jun 2026 – Aug 2026**

Lynx Equity Limited (3rd consecutive summer)

- Shipped releases on the company's investor website through the Webflow API, each gated on scripted checks against staging and production. A round of 14 changes went from request to live in an afternoon, against two days by hand.
- Replaced all 51 portfolio-company bios in one scripted API pass, checked by a rule built to break if a bio landed on the wrong company. All 51 mapped correctly, with 3 extraction defects caught before publish.
- Verified 7 stage transitions across the 6 boards of the portfolio's Monday.com system, shipped a 5-field gate enforced in the UI and API, and traced a defect measuring project age from approval rather than start.

Independent Software Developer **Nov 2025 – Present**

- Build desktop, web, and automation projects, including an AI workspace, a 100-game arcade, and a meeting-transcript app.
- Completed a crypto market-making feasibility study in three weeks; seven days of recorded market data produced a NOT_READY verdict across all 75 pairs.

IT Intern **Jun 2024 – Aug 2024; Jun 2025 – Aug 2025**

Lynx Equity Limited

- Built a task management system on Monday.com that routed issues to the right workflow queue across subsidiaries and internal departments.
- Wrote Google Apps Script (JavaScript) that consolidates multiple Excel exports into one Google Sheet, applies pricing logic, and tracks unmatched keys for reconciliation.

Game Developer (Independent) **January 2024 – March 2024**

Mega Tic-Tac-Toe

- Built a Unity game on a 3×3 grid of linked Tic-Tac-Toe boards where each move sets the opponent's next board, and winning a board claims one square. Supports local and online multiplayer, plus single player vs. a Minimax AI.

Design Team Member **October 2023 – March 2024**

QMIND · Queen's AI Hub

- Trained a Blackjack agent with reinforcement learning on a team project. Built a tabular Q-learning baseline with training loop and tests, then helped migrate it to Deep Q-learning so the model could learn policies beyond a lookup table.

PERSONAL PROJECTS

Cockpit (TypeScript · React · Electron)

- Built a Windows workspace for Claude, Codex, and local models with one-click handoffs between engines, recovery after restarts and usage limits, a phone companion, and 5,300+ automated tests.

Workshop Arcade (JavaScript · HTML Canvas · Playwright)

- Built a public 100-game browser arcade with search, favorites, saved play and offline support; release checks exercise every game and phone/desktop layouts.

Dictation (Next.js · TypeScript · Python · Whisper)

- Built live dictation, meeting transcripts, private note sharing and audio downloads, with recoverable uploads and laptop-based speech processing.

Odds Aggregator (Python · Playwright · SQLite/Alembic)

- Production arbitrage daemon with collectors for 17 bookmakers across 7 sports.

Writing: jakethehoffer.github.io/website/#writing, short essays on engineering tradeoffs.
